January - May 2025

**DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING
FACULTY OF ENGINEERING
PES UNIVERSITY**

(Established under Karnataka Act No. 16 of 2013)
100ft Ring Road, Bengaluru – 560 085, Karnataka, India

Problem Statement:

- Traditional library management involves **manual record-keeping**, leading to inefficiencies such as **book misplacement, slow book searching, and difficulty tracking due dates**.
- The LMS aims to streamline these processes by providing a **centralized digital platform** for managing library activities

Key Features:

1. Book Catalog Management

- Librarians can **add, update, and remove books** from the Catalog.
- Members can **search** books by title, author, subject, and publication date.

2. User Management

- New members can **register**.
- Users can **log in/logout** and view their accounts.
- Membership can be cancelled or updated.

3. Book Transactions

- **Borrowing & Returning:** Members can **checkout** books, and librarians issue books.
- **Reservations:** Members can **reserve** books and cancel reservations.
- **Overdue Fines:** Users must pay fines for late returns.

4. Notifications

- System sends **overdue notifications**.
- Members receive **reservation availability** and **cancellation notifications**.

5. Assumptions & Constraints

Assumptions

1. A **single book copy** can be issued to **only one member at a time**.
2. Members can **reserve a book**
3. Books must be **returned on time**, failing which **fines** are applied.
4. Members need **valid membership** to borrow or reserve books.
5. Only **librarians** can manage the book catalog and issue books.

Constraints

1. The **number of books issued** to a member is **limited (e.g., max 3 books at a time)**.
2. The system should handle **multiple concurrent users** efficiently.
3. **Database storage constraints** may limit the number of books in the system.
4. The **notifications system** should function in real-time for better user experience.

6. Use Case Scenario

Scenario 1: Book Borrowing Process

- A **member logs into** the system and **searches for a book**.
- If the book is available, they **request checkout**.
- The librarian **issues the book**, updating the system.
- If the book is **not returned on time**, an **overdue notification** is sent, and a **fine is imposed**.

Scenario 2: Book Reservation

- A book is currently **checked out** by another member.
- A second member places a **reservation** for the book.
- When the book is returned, the system **sends an availability notification**.

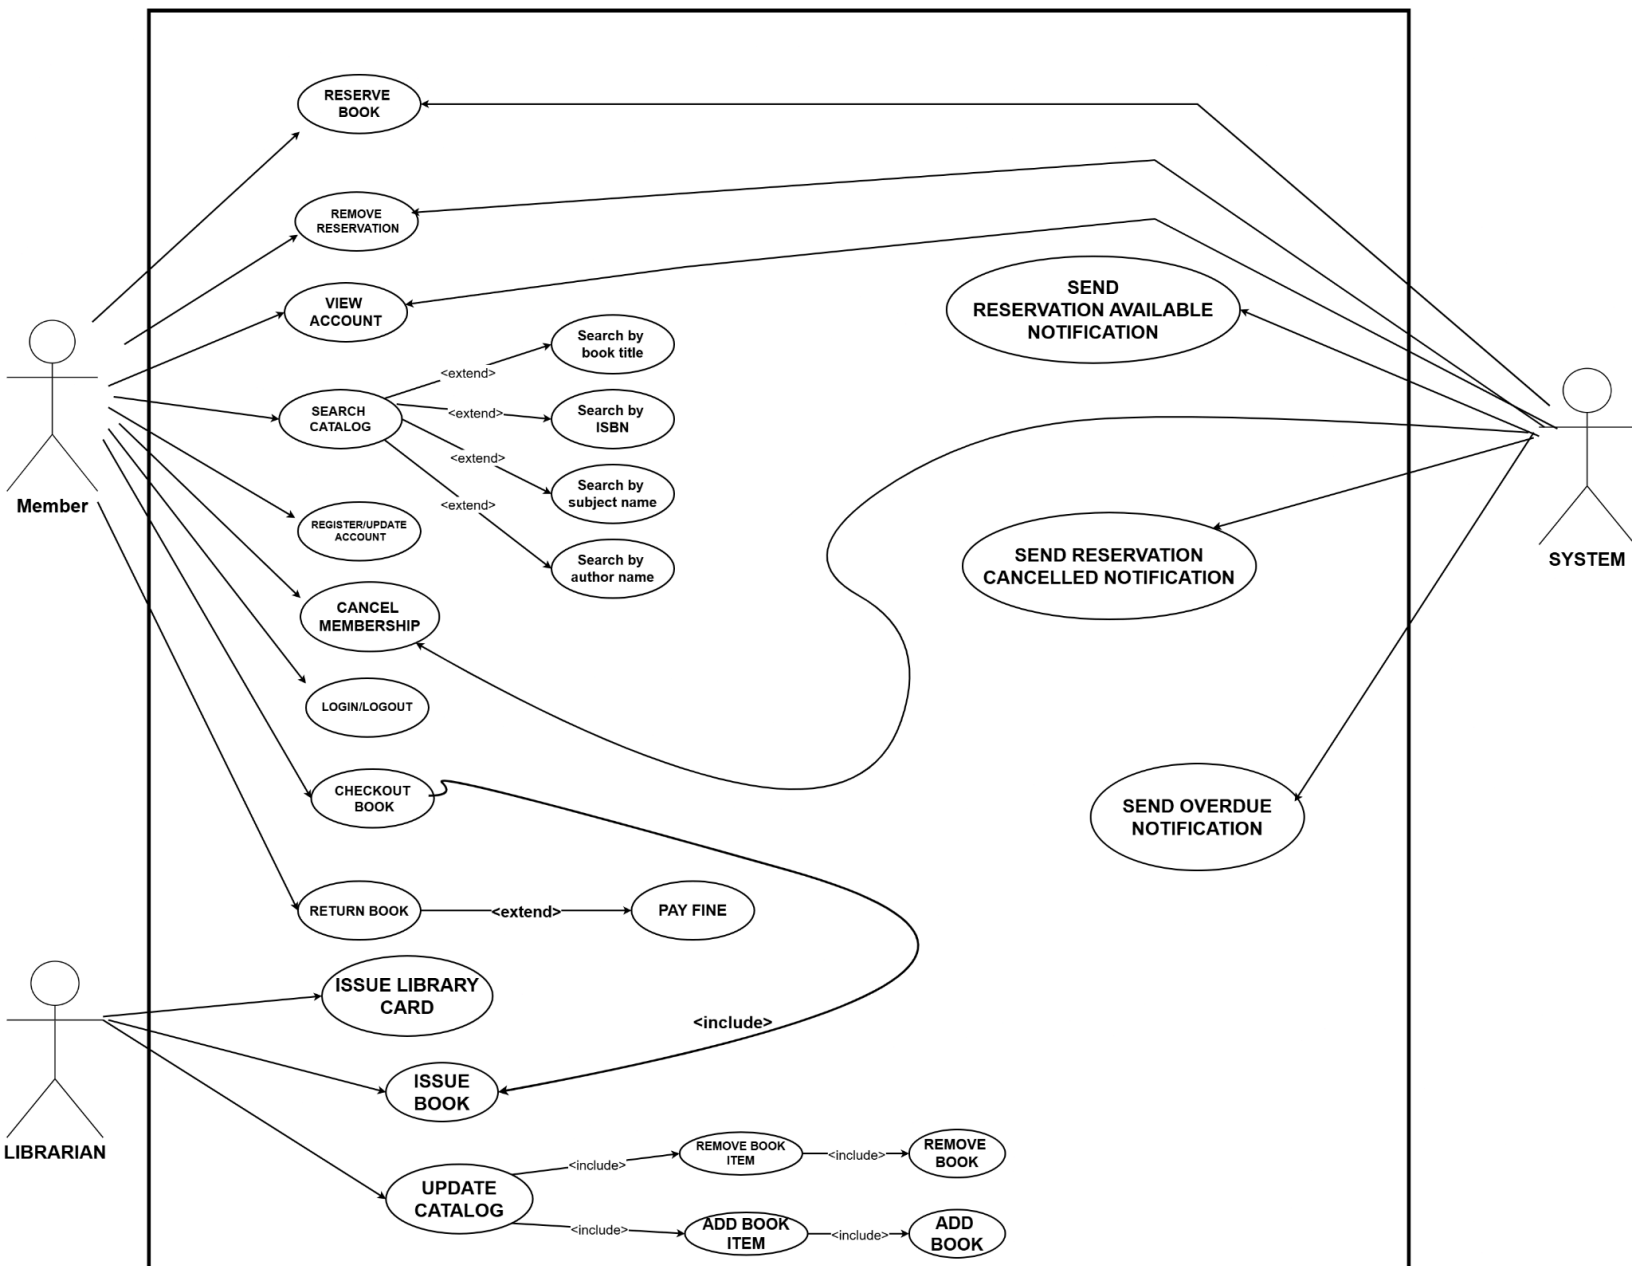

Scenario 3: Catalog Management

- A librarian logs in and **adds a new book** to the catalog.
- They can also **edit book details** (title, author, year) if needed.
- If a book is no longer in circulation, they can **remove it from the catalog**.

Architecture Patterns, Design Principles, and Design Patterns:

Architecture Patterns

Model – View – Controller Pattern (MVC)

Design Principles

1. Single Responsibility Principle (SRP)

- *Implementation:* Each service class has a specific responsibility (BookService, MemberService, FineService)
- *Example:* FineService only handles fine-related operations, not book or member operations
- *Benefits:* Focused classes, easier maintenance, better testability

2. Open/Closed Principle (OCP)

- *Implementation:* Extension of functionality without modifying existing code
- *Example:* The status enum system (BookStatus, AccountStatus, ReservationStatus) allows adding new statuses without changing the behavior of existing code
- *Benefits:* Reduced risk of breaking existing functionality, ease of extending features

3. Dependency Inversion Principle (DIP)

- *Implementation:* High-level modules depend on abstractions, not concrete implementations
- *Example:* Controllers depend on service interfaces, not implementations
- *Benefits:* Loosely coupled code, easier unit testing with mock implementations

4. Interface Segregation Principle (ISP)

- *Implementation:* Clients only depend on methods they use
- *Example:* Repository interfaces that define specific query methods
- *Benefits:* Avoids forcing clients to depend on methods they don't need

Design Patterns

1. Facade Pattern

- *Implementation:* LibraryFacade simplifies complex operations by providing a unified interface to multiple subsystems.
- *Benefits:* Provides simplified interface, reduces dependencies between client code and subsystems

2. Builder Pattern

- *Implementation:* BookItemBuilder for constructing complex BookItem objects step-by-step
- *Benefits:* Improves readability, step-by-step construction, encapsulates complex construction

3. Command Pattern

- *Implementation:* CommandInvoker, CheckoutCommand, ReturnCommand for encapsulating operations
- *Benefits:* Decouples operations ,supports operation queueing

4. Adapter Pattern

- The adapter pattern has been implemented for fine calculation in the Library Management System to separate the fine calculation logic from the lending process.
- This pattern is particularly useful when:
- You want to use an existing class, but its interface doesn't match what you need
- You want to create a reusable class that cooperates with classes that don't necessarily have compatible interfaces
- You need to integrate classes that couldn't otherwise work together due to incompatible interfaces

Screenshots

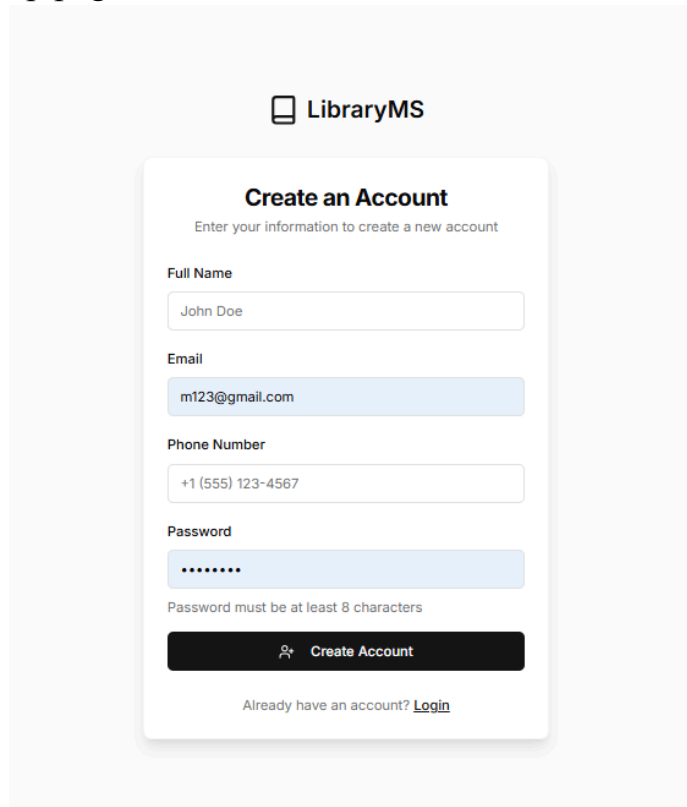

UI:

- Login Page

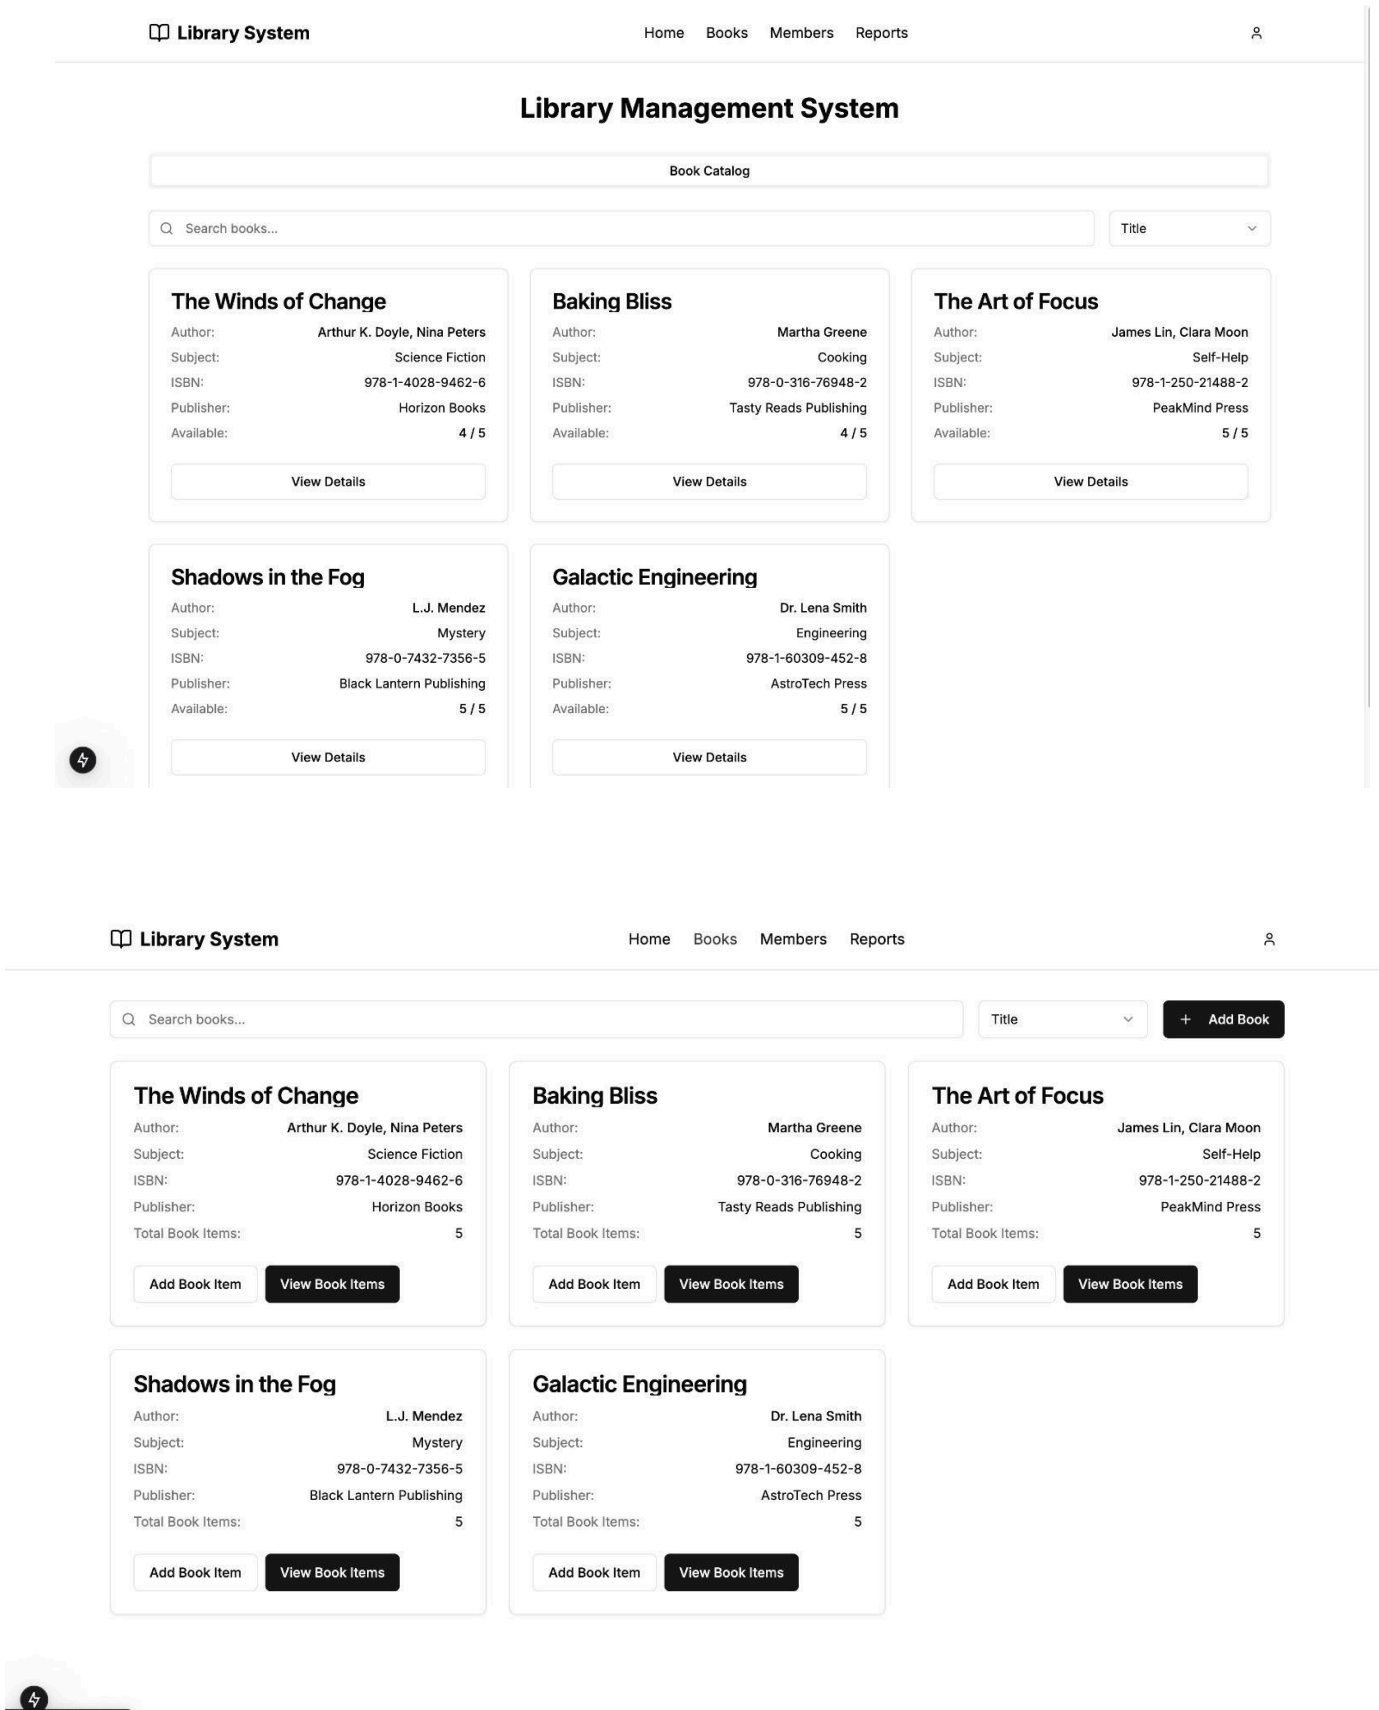

The screenshot shows the LibraryMS login page. At the top, there is a logo consisting of a book icon and the text "LibraryMS". Below the logo is a white card with a shadow. The card has a title "Login" and a subtitle "Enter your credentials to access your account". There are two input fields: "Email" with the value "m123@gmail.com" and "Password" with masked characters "*****". A link "Forgot password?" is next to the password field. Below the fields is a black button with a white login icon and the text "Login". At the bottom of the card, it says "Don't have an account? [Sign up](#)".

- Sign Up page

The screenshot shows the LibraryMS sign up page. At the top, there is a logo consisting of a book icon and the text "LibraryMS". Below the logo is a white card with a shadow. The card has a title "Create an Account" and a subtitle "Enter your information to create a new account". There are four input fields: "Full Name" with the value "John Doe", "Email" with the value "m123@gmail.com", "Phone Number" with the value "+1 (555) 123-4567", and "Password" with masked characters "*****". A link "Forgot password?" is next to the password field. Below the fields is a black button with a white user icon and the text "Create Account". At the bottom of the card, it says "Already have an account? [Login](#)".
